Summarize the Data

Question 1. Present a bar graph showing the proportion of states with a change in their cigarette tax in each year from 1970 to 1985.

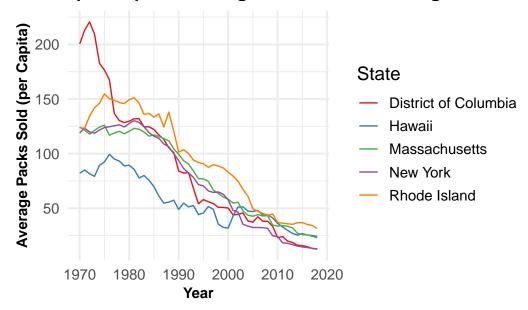

Question 2. Plot on a single graph the average tax (in 2012 dollars) on cigarettes and the average price of a pack of cigarettes from 1970 to 2018.

ge Cigarette Tax and Price, 1970-2018

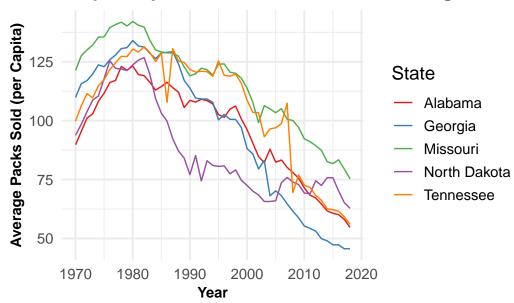

Question 3. Identify the 5 states with the highest increases in cigarette prices (in dollars) over the time period. Plot the average number of packs sold per capita for those states from 1970 to 2018.

ks Sold per Capita for 5 Highest Price-Increasing States

Question 4. Identify the 5 states with the lowest increases in cigarette prices over the time period. Plot the average number of packs sold per capita for those states from 1970 to 2018.

acks Sold per Capita for 5 Lowest Price-Increasing States

Question 5. Compare the trends in sales from the 5 states with the highest price increases to those with the lowest price increases.

The 5 states with the highest increase in cigarette prices have a sharp decline over time in the average number of packs sold. Meanwhile, the 5 states with the lowest price increase for cigarettes have a more stable average number of packs sold over time, although there is still a steady declune. Both datasets have a maximum average number of packs sold around 1980, and then the averages drop over time. All 5 of the states with the highest price increase sell less packs per capita than all 5 of the low price increase states in later years, starting around 2015.

Estimate ATEs

Question 6. Focusing only on the time period from 1970 to 1990, regress log sales on log prices to estimate the price elasticity of demand over that period. Interpret your results.

```
Call:
lm(formula = log_sales ~ log_price, data = data_1970_1990)
Residuals:
     Min
               1Q
                    Median
                                 3Q
                                         Max
-0.77629 -0.09967 -0.00787 0.09969 0.78423
Coefficients:
             Estimate Std. Error t value Pr(>|t|)
                                   585.3
(Intercept) 4.750402
                        0.008116
                                           <2e-16 ***
                                   -12.4
                                           <2e-16 ***
log_price
            -0.171540
                        0.013829
Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
Residual standard error: 0.2107 on 1069 degrees of freedom
Multiple R-squared: 0.1258,
                                Adjusted R-squared: 0.125
F-statistic: 153.9 on 1 and 1069 DF, p-value: < 2.2e-16
```

Interpretation of results:

Question 7. Again limiting to 1970 to 1990, regress log sales on log prices using the total (federal and state) cigarette tax (in dollars) as an instrument for log prices. Interpret your results and compare your estimates to those without an instrument. Are they different? If so, why?

	Length	Class	Mode
